## Instructions

- Write your name and code on each page.
- You have 5 hours to work on the problems. Begin only when the START command is given.
- Use only the pen and calculator provided.
- All results must be written in the appropriate boxes. Anything written elsewhere will not be graded. Use the reverse of the sheets if you need scratch paper.
- Write relevant calculations in the appropriate boxes when necessary. If you provide only correct end results for complicated problems, you receive no score.
- When you have finished the examination, you must put your papers into the envelope provided. Do not seal the envelope.
- You must stop your work immediately when the STOP command is given. A delay in doing this by 3 minutes may lead to cancellation of your exam.
- Do not leave your seat until permitted by the supervisors.
- This examination has 26 pages.
- The official English version of this examination is available on request only for clarification.

## Constants and Formulae

Avogadro
constant:
Gas constant:
Faraday constant: $F=96485 \mathrm{C} \mathrm{mol}^{-1}$
Planck constant: $\quad h=6.626 \cdot 10^{-34} \mathrm{~J} \mathrm{~s}$

Speed of light:
Zero of the Celsius scale:
$N_{\mathrm{A}}=6.022 \cdot 10^{23} \mathrm{~mol}^{-1} \quad$ Ideal gas equation: $\quad p V=n R T$
$R=8.314 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1} \quad$ Gibbs energy: $\quad G=H-T S$
$\Delta_{\mathrm{r}} G^{\circ}=-R T \ln K=-n F E_{\text {cell }}^{o}$
Nernst equation:

$$
E=E^{o}+\frac{R T}{z F} \ln \frac{c_{0 \times}}{c_{\mathrm{red}}}
$$

Energy of a photon: $E=\frac{h c}{\lambda}$
Lambert-Beer law: $\quad A=\log \frac{I_{0}}{l}=\varepsilon c l$
In equilibrium constant calculations all concentrations are referenced to a standard concentration of $1 \mathrm{~mol} / \mathrm{dm}^{3}$. Consider all gases ideal throughout the exam.

| :--- | :--- | :--- | :--- | :--- |
| 4 | 2 | 8 | 8 | 22 |
|  |  |  |  |  |

The label on a bottle containing a dilute aqueous solution of an acid became damaged. Only its concentration was readable. A pH meter was nearby, and a quick measurement showed that the hydrogen ion concentration is equal to the value on the label.
a) Give the formulae of four acids that could have been in the solution if the pH changed one unit after a tenfold dilution.

Any univalent, strong acid $(\mathrm{HCl}$, $\mathrm{HBr}, \mathrm{HI}, \mathrm{HNO}_{3}, \mathrm{HClO}_{4}$ ) is acceptable. HF is not!
b) Could it be possible that the dilute solution contained sulfuric acid?

Sulfuric acid: $\mathrm{p} K_{\mathrm{a} 2}=1.99$
$\square$ Yes $\square$ No
If yes, calculate the pH (or at least try to estimate it) and show your work.
No, the first dissociation step can be regarded as complete in aqueous solutions, thus $\left[\mathrm{H}^{+}\right]>c_{\text {acid. }}$.

2 points are given for 'No'.
No text or calculations are needed later, and no pts will be given here.
pH :
c) Could it be possible that the solution contained acetic acid?

Acetic acid: $\quad \mathrm{p} K_{\mathrm{a}}=4.76$
$\square$ Yes $\square$ No
If yes, calculate the pH (or at least try to estimate it) and show your work.
Yes, but only in quite dilute solutions can this happen. 1 pt for ticking yes

$$
\begin{align*}
& c=[\mathrm{HA}]+\left[\mathrm{A}^{-}\right]=\left[\mathrm{H}^{+}\right]  \tag{1pt}\\
& {\left[\mathrm{H}^{+}\right]=\left[\mathrm{A}^{-}\right]+\left[\mathrm{OH}^{-}\right]} \tag{1pt}
\end{align*}
$$

This means that $[\mathrm{HA}]=\left[\mathrm{OH}^{-}\right]$
Formula:
$K=\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{A}^{-}\right]}{[\mathrm{HA}]}=\frac{\left[\mathrm{H}^{+}\right]\left(\left[\mathrm{H}^{+}\right]-\left[\mathrm{OH}^{-}\right]\right)}{\left[\mathrm{OH}^{-}\right]}=\frac{\left[\mathrm{H}^{+}\right]^{3}}{K_{\mathrm{w}}}-\left[\mathrm{H}^{+}\right] \quad(2 \mathrm{pt})$
The pH of the solution must be acidic, but close to 7 .
6.5 is a good guess. ( 1 pt for reasonable guess - between 6 and 7 )

A good approximation is: $\left[\mathrm{H}^{+}\right]=\sqrt[3]{\left(K K_{w}\right)}$
The full equation can be solved through iteration: $\left[\mathrm{H}^{+}\right]=\sqrt[3]{\left(K+\left[\mathrm{H}^{+}\right]\right) K_{w}}$ Starting with a neutral solution two cycles of iteration give identical results: $5.64 \cdot 10^{-7} \mathrm{~mol} / \mathrm{dm}^{3}$ as the required concentration. Exact pH is 6.25 . 3 pts
pH :
d) Could it be possible that the solution contained EDTA (ethylene diamino tetraacetic acid)? You may use reasonable approximations.
EDTA: $\mathrm{p} K_{\mathrm{a} 1}=1.70, \mathrm{p} K_{\mathrm{a} 2}=2.60, \mathrm{p} K_{\mathrm{a} 3}=6.30, \mathrm{p} K_{\mathrm{a} 4}=10.60$Yes $\square$ No
If yes, calculate the concentration.

```
Yes (1 pt)
```

We can suppose that this solution would be quite acidic, so the $3^{\text {rd }}$ and $4^{\text {th }}$ dissociation steps can be disregarded. (1 pt) The following equations are thus true:

$$
\begin{align*}
& c=\left[\mathrm{H}_{4} \mathrm{~A}\right]+\left[\mathrm{H}_{3} \mathrm{~A}^{-}\right]+\left[\mathrm{H}_{2} \mathrm{~A}^{2-}\right]=\left[\mathrm{H}^{+}\right]  \tag{1pt}\\
& {\left[\mathrm{H}^{+}\right]=\left[\mathrm{H}_{3} \mathrm{~A}^{-}\right]+2\left[\mathrm{H}_{2} \mathrm{~A}^{2-}\right]} \tag{1pt}
\end{align*}
$$

This means that $\left[\mathrm{H}_{4} \mathrm{~A}\right]=\left[\mathrm{H}_{2} \mathrm{~A}^{2-}\right](1 \mathrm{pt})$

$$
\begin{equation*}
K_{1} K_{2}=\frac{\left[\mathrm{H}^{+}\right]^{2}\left[\mathrm{H}_{2} \mathrm{~A}^{2-}\right]}{\left[\mathrm{H}_{4} \mathrm{~A}\right]}=\left[\mathrm{H}^{+}\right]^{2}\left(\mathrm{or} \mathrm{pH}=\left(\mathrm{p} K_{1}+\mathrm{p} K_{2}\right) / 2=2.15\right) \tag{2pts}
\end{equation*}
$$

$c=0.0071 \mathrm{~mol} / \mathrm{dm}^{3}(1 \mathrm{pt})$

Determine the structure of the compounds $\mathbf{A - H}$ (stereochemistry is not expected), based on the information given in the following reaction scheme:

Hints:

- $\mathbf{A}$ is a well-known aromatic hydrocarbon.
- A hexane solution of $\mathbf{C}$ reacts with sodium (gas evolution can be observed), but $\mathbf{C}$ does not react with chromic acid.
- ${ }^{13} \mathrm{C}$ NMR spectroscopy shows that $\mathbf{D}$ and $\mathbf{E}$ contain only two kinds of $\mathrm{CH}_{2}$ groups.
- When a solution of $\mathbf{E}$ is heated with sodium carbonate an unstable intermediate forms at first, which gives $\mathbf{F}$ on dehydration.

|  |  |  |  |

Vinpocetine (Cavinton $®$, Calan $®$ ) is one of the best selling original drugs developed in Hungary. Its preparation relies on a natural precursor, (+)-vincamine ( $\mathrm{C}_{21} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{O}_{3}$ ), which is isolated from the vine plant, vinca minor. The transformation of (+)-vincamine to vinpocetine is achieved in two steps depicted below.

Vincamine
All compounds ( $\mathbf{A}$ to $\mathbf{F}$ ) are enantiomerically pure compounds.

- The elementary composition of $\mathbf{A}$ is: C 74.97\%, H 7.19\%, N 8.33\%, O 9.55\%.
- B has 3 other stereoisomers.
a) Propose structures for the intermediate $\mathbf{A}$ and vinpocetine (B).

A

B

B

A study of the metabolism of any drug forms a substantial part of its documentation. There are four major metabolites each formed from vinpocetine (B): C and $\mathbf{D}$ are formed in hydrolysis or hydration reactions, while $\mathbf{E}$ and $\mathbf{F}$ are oxidation products.

Hints:

- The acidity of the metabolites decreases in the order $\mathbf{C} \gg \mathbf{E} \gg \mathbf{D}$. $\mathbf{F}$ does not contain an acidic hydrogen.
- $\mathbf{C}$ and $\mathbf{E}$ each have 3 other stereoisomers, while $\mathbf{D}$ and $\mathbf{F}$ each have 7 other stereoisomers.
- $\mathbf{F}$ is a pentacyclic zwitterion and it has the same elementary analysis as $\mathbf{E}$ :
C 72.11\%, H 7.15\%, N 7.64\%, O 13.10\%.
- The formation of $\mathbf{E}$ from $\mathbf{B}$ follows an electrophilic pattern.
- The formation of $\mathbf{D}$ from $\mathbf{B}$ is both regio- and stereoselective.
b) Propose one possible structure for each of the metabolites C, D, E and F!

C apovincaminic acid
D

Both stereoisomers around the new chiral center are acceptable.
E

F

F vinpocetine N -oxide
All aromatic positions for the OH are acceptable in E .
c) Draw a resonance structure for $\mathbf{B}$ that explains the regioselective formation of $\mathbf{D}$ and the absence of the alternate regioisomer in particular.

|  |  |  |  |  |  |

A major transformation route for oxiranes (epoxides) is ring opening. This may be accomplished in various ways.

On acid catalysis the reactions proceed through cation-like (carbenium ion-like) species. For substituted oxiranes the direction of ring opening (which $\mathrm{C}-\mathrm{O}$ bond is cleaved) depends on the stability of the intermediate carbenium ion. The more stable the intermediate carbenium ion the more probable its formation. However, an open carbenium ion (with a planar structure) only forms if it is tertiary, benzylic or allylic.
On base catalysis the sterically less hindered $\mathrm{C}-\mathrm{O}$ bond is cleaved predominantly.
Keep stereochemistry in mind throughout the whole problem. To depict stereochemistry use only the - ...".illl - bond symbols and nothing else where necessary.
a) Draw the structure of the reactant and the predominant products when 2,2-dimethyloxirane (1,2-epoxy-2-methylpropane) reacts with methanol at low temperatures, catalysed by
(i) sulfuric acid
(ii) $\mathrm{NaOCH}_{3}$.

b) Draw the structure of the predominant product when the epoxide ring of the following leukotriene derivative is opened with a thiolate ( $\mathrm{RS}^{-}$).

Different porous acidic aluminosilicates can also be used to catalyse the transformation of alkyl oxiranes. In addition to ring opening, cyclic dimerisation is found to be the main

## Name:

reaction pathway producing mainly 1,4-dioxane derivatives (six-membered saturated rings with two oxygen atoms in positions 1,4).
c) Draw the structure(s) of the most probable 1,4-dioxane derivative(s) when the starting compound is (S)-2-methyloxirane ((S)-1,2-epoxypropane). Give the structure of the reactant as well.

(S)-2-methyloxirane

or

reactant 2 pts, product 2 pts, product stereochemistry 2 pts
d) Draw the structure(s) of the substituted 1,4-dioxane(s) when the epoxide reacting is $(R)$-1,2-epoxy-2-methylbutane ((R)-2-ethyl-2-methyloxirane). Give the structure of the reactant as well.
(R)-1,2-epoxy-2-methylbutane:

or

R,R

or

S,S

or

fino
R,S
If two structures given for the R,S (meso) product: 1 pt
e) Give the structure(s) of the substituted 1,4-dioxane(s) when this reaction is carried out with racemic 1,2-epoxy-2-methylbutane (2-ethyl-2-methyloxirane).

$\mathbf{A}$ and $\mathbf{B}$ are white crystalline substances. Both are highly soluble in water and can be moderately heated (up to $200^{\circ} \mathrm{C}$ ) without change but both decompose at higher temperatures. If an aqueous solution of 20.00 g A (which is slightly basic, $\mathrm{pH} \approx 8.5-9$ ) is added to an aqueous solution of 11.52 g B (which is slightly acidic, $\mathrm{pH} \approx 4.5-5$ ) a white precipitate $\mathbf{C}$ forms that weighs 20.35 g after filtering, washing and drying. The filtrate is essentially neutral and gives a brown colour reaction with an acidified KI solution. When boiled, the filtrate evaporates without the appearance of any residue.
The white solid $\mathbf{D}$ can be prepared by the heating of $\mathbf{A}$ in the absence of air. The exothermic reaction of $\mathbf{D}$ with water gives a colourless solution. This solution, if kept in an open container, slowly precipitates a white solid $\mathbf{E}$ and leaves water. Upon prolonged exposure to air at room temperature, solid $\mathbf{D}$ is transformed into $\mathbf{E}$ as well. However, heating $\mathbf{D}$ in air at $500^{\circ} \mathrm{C}$ produces a different white substance $\mathbf{F}$, which is barely soluble in water and has a mass of only $85.8 \%$ of the $\mathbf{E}$ formed from the same amount of $\mathbf{D} . \mathbf{F}$ gives a brown colour reaction with an acidified solution of KI.

E can be converted back into $\mathbf{D}$ but ignition above $1400^{\circ} \mathrm{C}$ is required for this purpose. The reaction of $\mathbf{B}$ and $\mathbf{D}$ in water forms the precipitate $\mathbf{C}$ and is accompanied by a characteristic odour.
a) Give the formulae of the substances A-F

| A | $\mathrm{Ba}(\mathrm{N}$ | 8 pts | B | $\left(\mathrm{NH}_{4}\right)_{2}$ | 8 pts | C BaSO | 4 pts | 25 bonus points if both $\mathbf{A}$ and $\mathbf{B}$ are identified correctly. |

$\mathrm{NH}_{4}{ }^{+}+\mathrm{OH}^{-}=\mathrm{NH}_{3}+\mathrm{H}_{2} \mathrm{O} \quad 1 \mathrm{pt}$

Detailed solution:
The problem contains quite a number of clues to the identification of the compounds. It is clear that $\mathbf{A}, \mathbf{D}, \mathbf{E}$, and $\mathbf{F}$ all contain the same element; with a water-soluble solid compound stable at $1400^{\circ} \mathrm{C}$, probably a metal. The aqueous solution of a metal compound giving a precipitate and pure water upon standing in the air strongly hints at the formation of a carbonate, possibly from a soluble hydroxide. A likely conclusion is that $\mathbf{D}$ is an oxide, limiting the choice of the metal to Sr or Ba . (One might also consider $\mathrm{Li}, \mathrm{Ca}$, or TI which are less satisfactory because $\mathrm{Ca}(\mathrm{OH})_{2}$ is poorly soluble while the solubilities of $\mathrm{Li}_{2} \mathrm{CO}_{3}$ and $\mathrm{Tl}_{2} \mathrm{CO}_{3}$ are quite significant.) If $\mathbf{E}$ is an alkaline earth metal carbonate, then the molar mass of $F$ could be either $M_{\mathrm{Ca}}+45.8$, or $M_{\mathrm{Sr}}+$ 39.05 , or $M_{\mathrm{Ba}}+32$. Since $\mathbf{F}$ is formed by heating the oxide in air, the former two do not make any sense while the latter is consistent with $\mathrm{BaO}_{2}$. This is confirmed by the oxidative capability of $\mathbf{F}$.
The odour appearing in the reaction of $\mathbf{B}$ with $\mathrm{Ba}(\mathrm{OH})_{2}$ indicates that the former might be an ammonium salt. Assuming that the reaction of $\mathbf{A}$ and $\mathbf{B}$ is a simple precipitation between a barium salt and an ammonium salt, we get an equivalent mass of 48 for the anion of the precipitate. This might be either $\mathrm{SO}_{4}{ }^{2-}$ or $\mathrm{HPO}_{4}{ }^{2-}$ but the acidity of $\mathbf{B}$ is consistent with the former and, in addition, $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{HPO}_{4}$ would not give the same $\mathrm{BaHPO}_{4}$ precipitate with $\mathrm{Ba}(\mathrm{OH})_{2}$ as with $\mathrm{Ba}\left(\mathrm{NO}_{2}\right)_{2}$. If we accept that B is $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4}$, we obtain an equivalent mass of 46 for the anion of $\mathbf{A}$. This and the surrounding chemistry are consistent with the nitrite ion.

A feathery, greenish solid precipitate can be observed if chlorine gas is bubbled into water close to its freezing point. Similar precipitates form with other gases such as methane and noble gases. These materials are interesting because vast quantities of the so-called methane-hydrates are supposed to exist in nature (comparable in quantity with other natural gas deposits).

These precipitates all have related structures. The molecules of water just above its freezing point form a hydrogen-bonded structure. The gas molecules stabilize this framework by filling in the rather large cavities in the water structure forming clathrates.
The crystals of chlorine and methane clathrates have the same structure. Their main characteristics are dodecahedra formed from 20 water molecules. The unit cell of the crystal can be thought as a body-centered cubic arrangement built from these dodecahedra which are almost spherical objects. The dodecahedra are connected via additional water molecules located on the faces of the unit cell. Two water molecules can be found on each face of the unit cell. The unit cell has an edge dimension of 1.182 nm .

There are two types of cavities in this structure. One is the internal space in the dodecahedra (A). These are somewhat smaller than the other type of voids (B), of which there are 6 for each unit cell.
a) How many type $\mathbf{A}$ cavities can be found in a unit cell?

2
b) How many water molecules are there in a unit cell?

$$
46=20 \times 2 \text { (dodecahedra) + 6x2 /2 (faces) }
$$

c) If all cavities contain a guest molecule, what is the ratio of the number of water to the number of guest molecules?

$$
46: 8=5.75
$$

d) Methane hydrate is formed with the structure in c) at temperatures between $0-10{ }^{\circ} \mathrm{C}$. What is the density of the clathrate?

A unit cell has a volume of $1.182^{3} \mathrm{~nm}^{3}=1.651 \mathrm{~nm}{ }^{3} .2 \mathrm{pt}$
It contains 8 methane and 46 water molecules with a mass of $957 \mathrm{~g} \mathrm{~mol}^{-1} / \mathrm{N}_{\mathrm{A}}=$ $1.589 \cdot 10^{-21} \mathrm{~g}$. 2 pt
The density is $1.589 / 1.651=0.962 \mathrm{~g} / \mathrm{cm}^{3} . \quad 2 \mathrm{pt}$
40th IChO Theoretical Problems, Official English version

Density:
e) The density of chlorine hydrate is $1.26 \mathrm{~g} / \mathrm{cm}^{3}$. What is the ratio of the number of water and guest molecules in the crystal?

The mass of a unit cell with this density is: $1.651 \mathrm{~nm}^{3} \cdot 1.26 \mathrm{~g} / \mathrm{cm}^{3}=2.081 \cdot 10^{-21} \mathrm{~g}$, meaning $1253 \mathrm{~g} / \mathrm{mol}$ for the contents.
Substracting the waters, this means $424.3 \mathrm{~g} / \mathrm{mol}$ for the chlorine atoms, giving 11.97 chlorine atoms in a unit cell. 2 pts

The ratio is then $6(5.98)$ chlorine molecules for the 46 waters, or a ratio of 7.68 .
1 pts
It is expected that only the 6 larger B type cavities contain chlorine. 3 pts

Ratio:
Which cavities are likely to be filled in a perfect chlorine hydrate crystal? Mark one or more.Some ASome B $\square$ All AAll B

Covalent radii reflect atomic distances when the atoms are covalently bonded. Nonbonded or van der Waals radii give a measure of the atomic size when they are not bonded covalently (modeled as hard spheres).

| Atom | Covalent radius (pm) | Nonbonded radius (pm) |
| :---: | :---: | :---: |
| H | 37 | 120 |
| C | 77 | 185 |
| O | 73 | 140 |
| Cl | 99 | 180 |

f) Based on the covalent and nonbonded radii of these atoms estimate lower and upper bounds for the average radii of the cavities where possible. Show your reasoning.

Methane fits in both cavities, its radius is appr. $37+77+120 \mathrm{pm}=234 \mathrm{pm} . \quad 3 \mathrm{pts}$ The chlorine molecule, with a radius of $180+99 \mathrm{pm}=279 \mathrm{pm}$, fits only in B. 3 pts Thus $234 \mathrm{pm}<r(\mathbf{A})<279 \mathrm{pm}$ and $279 \mathrm{pm}<r(\mathbf{B})$

$$
2 \text { pts } 2 \text { pts } \quad 2 \text { pts }
$$

$$
<r(\mathbf{A})<\quad<r(\mathbf{B})
$$

Let us consider the following processes

$$
\begin{align*}
& \mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{~s})  \tag{1}\\
& x \mathrm{CH}_{4}(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightarrow \mathrm{xCH}_{4} .1 \mathrm{H}_{2} \mathrm{O} \text { (clathrate) } \tag{2}
\end{align*}
$$

g) What are the signs of the following molar quantities referring to these reactions in the given direction at $4^{\circ} \mathrm{C}$ ? Mark with $\mathrm{a}-, 0$ or + .

|  | sign |
| :--- | :--- |
| $\Delta G_{m}(1)$ |  |
| $\Delta G_{m}(2)$ |  |
| $\Delta H_{m}(1)$ |  |
| $\Delta H_{m}(2)$ |  |
| $\Delta S_{m}(1)$ |  |
| $\Delta S_{m}(2)$ |  |
| $\Delta S_{m}(2)-\Delta S_{m}(1)$ |  |
| $\Delta H_{m}(2)-\Delta H_{m}(1)$ |  |

```
+, -, -, -, -, -, -, -,
Under these conditions, methane clathrate
forms, while ice melts to water, so the Gibbs
energy changes are of opposite signs.
Freezing is an exothermic process with an
entropy decrease in both cases.
The entropy decrease of the clathrate
formation is larger in magnitude, as it
involves a gas-solid transition.
The relation of the reaction enthalpies can be
inferred from these facts:
\DeltaGm(1) > \DeltaGGm(2)
\DeltaHm(1) -T\DeltaS (1) > \DeltaH (2) -T\DeltaS (2)
T(\Delta\mp@subsup{S}{m}{\prime}(2) - \DeltaS (1) )>\Delta (Hm(2) - \DeltaH (1)
a negative quantity >\DeltaH
1 pt each, the last 3 pts.

The dithionate ion $\left(\mathrm{S}_{2} \mathrm{O}_{6}{ }^{2-}\right)$ is a rather inert inorganic ion. It can be prepared by bubbling sulphur-dioxide continously into ice-cooled water to which manganese dioxide is added in small increments. Dithionate and sulphate ions are formed under these circumstances.
a) Write the balanced chemical equations for the two reactions.

$$
\begin{aligned}
& \mathrm{MnO}_{2}+2 \mathrm{SO}_{2} \rightarrow \mathrm{Mn}^{2+}+\mathrm{S}_{2} \mathrm{O}_{6}^{2-} \\
& \mathrm{MnO}_{2}+\mathrm{SO}_{2} \rightarrow \mathrm{Mn}^{2+}+\mathrm{SO}_{4}^{2-} \quad 1 \text { pt each }
\end{aligned}
$$

After the reaction is complete, $\mathrm{Ba}(\mathrm{OH})_{2}$ is added to the mixture until the sulphate ions are fully precipitated. This is followed by the addition of $\mathrm{Na}_{2} \mathrm{CO}_{3}$.
b) Write the balanced equation for the reaction that takes place upon addition of $\mathrm{Na}_{2} \mathrm{CO}_{3}$.

$$
\mathrm{MnS}_{2} \mathrm{O}_{6}+\mathrm{Na}_{2} \mathrm{CO}_{3} \rightarrow \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{6}+\underline{\mathrm{MnCO}_{3}} \quad 1 \mathrm{pt}
$$

Sodium dithionate is then crystallized by evaporating some of the solvent. The prepared crystals dissolve readily in water and do not give a precipitate with $\mathrm{BaCl}_{2}$ solution. When the solid is heated and maintained at $130^{\circ} \mathrm{C}, 14.88 \%$ weight loss is observed. The resulting white powder dissolves in water and does not give a precipitate with $\mathrm{BaCl}_{2}$ solution. When another sample of the original crystals is kept at $300^{\circ} \mathrm{C}$ for a few hours, $41.34 \%$ weight loss occurs. The resulting white powder dissolves in water and gives a white precipitate with $\mathrm{BaCl}_{2}$ solution.
c) Give the composition of the prepared crystals and write balanced equations for the two processes that occur during heating.

Formula:

$$
\begin{aligned}
& \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{6} \cdot 2 \mathrm{H}_{2} \mathrm{O} \quad \text { (2 pts only for the correct formula) } \\
& \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{6} \cdot 2 \mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{6}+2 \mathrm{H}_{2} \mathrm{O}(1 \mathrm{pt}) \\
& \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{6} \rightarrow \mathrm{Na}_{2} \mathrm{SO}_{4}+\mathrm{SO}_{2} \text { or with } \mathrm{H}_{2} \mathrm{O}(1 \mathrm{pt})
\end{aligned}
$$

Equation $\left(300^{\circ} \mathrm{C}\right)$ :

## Name:

Although dithionate ion is a fairly good reducing agent thermodynamically, it does not react with oxidants in solution at room temperature. At $75^{\circ} \mathrm{C}$, however, it can be oxidized in acidic solutions. A series of kinetic experiments were carried out with bromine as an oxidant.
d) Write the balanced chemical equation for the reaction between bromine and dithionate ion.

$$
\mathrm{S}_{2} \mathrm{O}_{6}{ }^{2-}+\mathrm{Br}_{2}+2 \mathrm{H}_{2} \mathrm{O} \rightarrow 2 \mathrm{SO}_{4}{ }^{2-}+2 \mathrm{Br}^{-}+4 \mathrm{H}^{+} \quad 2 \mathrm{pts}
$$

The initial rates $\left(v_{0}\right)$ of the reaction were determined in a number of experiments at $75^{\circ} \mathrm{C}$.
\(\left.$$

| 0.500 | 0.0500 | 0.100 | 128 |

e) Determine the order of the reaction with respect to $\mathrm{Br}_{2}, \mathrm{H}^{+}$and $\mathrm{S}_{2} \mathrm{O}_{6}{ }^{2-}$, the experimental rate equation, and the value and unit of the rate constant.

| Reaction order for $\mathrm{Br}_{2}$ : | for $\mathrm{H}^{+}$: for $\mathrm{S}_{2} \mathrm{O}_{6}{ }^{2-}$ : |
| :---: | :---: |
| Experimental rate equation: | 01  <br>  $(2$ pts each $)$ |
|  | $v=k\left[\mathrm{~S}_{2} \mathrm{O}_{6}{ }^{2-}\right]\left[\mathrm{H}^{+}\right] \quad(1 \mathrm{pt})$ |
|  | $k=2.56 \cdot 10^{-5} \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~s}^{-1} \quad$ ( 1 pt : no point if unit is incorrect; unorthodox but correct unit acceptable) |
| $k$ : |  |

In similar experiments, chlorine, bromate ion, hydrogen peroxide and chromate ion have all been used as oxidizing agents at $75^{\circ} \mathrm{C}$. The rate equations for these processes are analogous to the one observed with bromine, the units of all rate constants are the same, the values are $2.53 \cdot 10^{-5}\left(\mathrm{Cl}_{2}\right), 2.60 \cdot 10^{-5}\left(\mathrm{BrO}_{3}^{-}\right), 2.56 \cdot 10^{-5}\left(\mathrm{H}_{2} \mathrm{O}_{2}\right)$, and $2.54 \cdot 10^{-5}\left(\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}\right)$.
Experiments were also carried out in acidic sodium dithionate solution without any oxidizing agent. When following the processes by UV spectrophotometry, the slow appearance of a new absorption band around 275 nm was observed. Although hydrogen sulphate ion is a detectable product of the reaction, it does not absorb any light above 200 nm .
f) Give the formula of the major species causing the new absorption band and write the balanced equation of the chemical reaction occurring in the absence of oxidants.

| Species: | $\mathrm{SO}_{2}\left(\right.$ or $\left.\mathrm{H}_{2} \mathrm{SO}_{3}\right)$ 3pts (2 pt for $\mathrm{HSO}_{3}{ }^{-}$or $\mathrm{SO}_{3}{ }^{2-}$ ) |
| :---: | :---: |
| Reaction: | $\mathrm{S}_{2} \mathrm{O}_{6}{ }^{2-}+\mathrm{H}^{+} \rightarrow \mathrm{HSO}_{4}^{-}+\mathrm{SO}_{2} \quad 2 \mathrm{pts}$ (if sulfur(IV) product is different but consistent with the previous answer also 2 pts ) |

An experiment was carried out to follow the absorbance at 275 nm with initial concentrations: $\left[\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{6}\right]=0.0022 \mathrm{~mol} / \mathrm{dm}^{3},\left[\mathrm{HClO}_{4}\right]=0.70 \mathrm{~mol} / \mathrm{dm}^{3}$, and the temperature was $75^{\circ} \mathrm{C}$. A pseudo first-order kinetic curve was found with a half-life of 10 hours and 45 minutes.
g) Calculate the rate constant of the reaction.

| $t_{1 / 2}=10 \mathrm{~h} 45 \mathrm{~min}=3.87 \cdot 10^{4} \mathrm{~s}$ <br> $k_{\text {obs }}=\ln 2 / \mathrm{t}_{1 / 2}=1.79 \cdot 10^{-5} \mathrm{~s}^{-1}$ <br> $k=k_{\text {obs }} /\left[\mathrm{H}^{+}\right]=2.56 \cdot 10^{-5} \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~s}^{-1}$ <br> units also acceptable) 2 pts <br> 2 pts (other consistent <br> $k$ :  |
| :--- | :--- |

Suggest a balanced chemical equation for the rate determining step of the reactions that used an oxidizing agent.

Rate determining step:

$$
\mathrm{S}_{2} \mathrm{O}_{6}{ }^{2-}+\mathrm{H}^{+} \rightarrow \mathrm{HSO}_{4}^{-}+\mathrm{SO}_{2} 4 \text { pts }
$$

When periodate ion (which is present as $\mathrm{H}_{4} \mathrm{IO}_{6}^{-}$in aqueous solution) was used as an oxidant for dithionate ion, the two kinetic curves depicted in the graph were detected at $75^{\circ} \mathrm{C}$ in the same experiment at two different wavelengths. The initial concentrations were $\left[\mathrm{H}_{4} \mathrm{IO}_{6}{ }^{-}\right]=5.3 \cdot 10^{-4} \mathrm{~mol} / \mathrm{dm}^{3},\left[\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{6}\right]=0.0519 \mathrm{~mol} / \mathrm{dm}^{3}$, $\left[\mathrm{HClO}_{4}\right]=0.728 \mathrm{~mol} / \mathrm{dm}^{3} \mathrm{At}$ 465 nm , only $\mathrm{I}_{2}$ absorbs and its molar absorption coefficient is $715 \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1}$. At 350 nm , only $\mathrm{I}_{3}{ }^{-}$absorbs and its molar absorption coefficient is $11000 \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1}$. The optical path length was 0.874 cm .

h) Write balanced chemical equations for the reactions that occur in the region where the absorbance increases at 465 nm , and in the region where the absorbance decreases at 465 nm .

Increase:

Decrease:

$$
\begin{aligned}
& 2 \mathrm{H}_{4} \mathrm{IO}_{6}^{-}+7 \mathrm{~S}_{2} \mathrm{O}_{6}^{2-}+2 \mathrm{H}_{2} \mathrm{O}+2 \mathrm{H}^{+} \rightarrow 14 \mathrm{HSO}_{4}^{-}+\mathrm{I}_{2} \quad 2 \mathrm{pts} \\
& \mathrm{I}_{2}+\mathrm{S}_{2} \mathrm{O}_{6}^{2-}+2 \mathrm{H}_{2} \mathrm{O} \rightarrow 2 \mathrm{HSO}_{4}^{-}+2 \mathrm{I}^{-}+2 \mathrm{H}^{+} \quad 2 \mathrm{pts}
\end{aligned}
$$

Calculate the expected time for the maximum absorbance of the kinetic curve measured at 465 nm .

$$
t_{\max }=\frac{7}{2} \frac{\left[\mathrm{H}_{4} \mathrm{IO}_{6}^{-}\right]_{0}}{k\left[\mathrm{~S}_{2} \mathrm{O}_{6}^{2-}\right]_{0}\left[\mathrm{H}^{+}\right]_{0}}=\frac{7 \times 5.3 \times 10^{-4} \mathrm{M}}{2 \times 2.56 \times 10^{-5} \mathrm{M}^{-1} \mathrm{~s}^{-1} \times 0.0519 \mathrm{M} \times 0.728 \mathrm{M}}=1900 \mathrm{~s}
$$

5 pts
$t_{\text {max }}$ :
Estimate the expected ratio of the slopes of the increasing and decreasing regions in the kinetic curve measured at 465 nm
slope ratio: 1: -7 (it reflects the stoichiometry) 3 pts

|  |  |  |  |  |  |  |  |  |  |

Ms. Z was a bright student, whose research project was to measure the complexation of all lanthanide(III) ions with newly designed complexing ligands. One day she monitored the UV-vis absorption with Ce (III) and a particularly poor complexing ligand in a spectrophotometer. She noticed that some small bubbles had formed in the closed cell by the end of the 12-hour experiment. Soon she realized that the presence of the ligand is not necessary to see the bubble formation, and continued her experiments with an acidified $\mathrm{CeCl}_{3}$ solution. Bubble formation never occurred when she just kept the solution in the spectrophotometer without turning on the instrument. Next, Ms. Z used a small quartz flask, in which she dipped a chloride ion selective electrode and could also withdraw samples regularly for spectrophotometric measurements. She calibrated the chloride ion selective electrode using two different NaCl solutions and obtained the following results:

| $C_{\mathrm{NaCl}}\left(\mathrm{mol} / \mathrm{dm}^{3}\right)$ | $E(\mathrm{mV})$ |
| :--- | :--- |
| 0.1000 | 26.9 |
| 1.000 | -32.2 |

a) Give a formula to calculate the chloride ion concentration of an unknown sample based on the electrode voltage reading $(E)$.

$$
\left[\mathrm{Cl}^{-}\right]=\quad\left[\mathrm{Cl}^{-}\right]=10^{-(E+32.2 \mathrm{mV}) 59.1 \mathrm{mV}}
$$

Ms. $Z$ also determined the molar absorption coefficient for $\mathrm{Ce}^{3+}\left(\varepsilon=35.2 \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1}\right)$ at 295 nm , and, as a precaution, also for $\mathrm{Ce}^{4+}\left(\varepsilon=3967 \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1}\right)$.
b) Give a formula to calculate the $\mathrm{Ce}^{3+}$ concentration from an absorbance reading at $295 \mathrm{~nm}(A)$ measured in a solution containing $\mathrm{CeCl}_{3}$ (cuvette path length: 1.000 cm ).

$$
\left[\mathrm{Ce}^{3+}\right]=\left[\mathrm{Ce}^{3+}\right]=\frac{A_{295 n m}}{35.2 \mathrm{dm}^{3} \mathrm{~mol}^{-1}}
$$

Ms. Z prepared a solution which contained $0.0100 \mathrm{~mol} / \mathrm{dm}^{3} \mathrm{CeCl}_{3}$ and $0.1050 \mathrm{~mol} / \mathrm{dm}^{3}$ HCl , and began her experiment by turning on a quartz lamp. HCl does not absorb at 295 nm .
c) What were the expected initial absorbance and voltage readings?

| $A_{295 \mathrm{~nm}}=$$\left[\mathrm{Ce}^{3+}\right]=0.0100 \mathrm{~mol} / \mathrm{dm}^{3} \Rightarrow A_{295 \mathrm{~nm}}=0.352$ <br> $E=\quad\left[\mathrm{Cl}^{-}\right]=3.0 .0100 \mathrm{~mol} / \mathrm{dm}^{3}+0.1050 \mathrm{~mol} / \mathrm{dm}^{3}=0.1350 \mathrm{~mol} / \mathrm{dm}^{3} \Rightarrow E=19.2 \mathrm{mV}$ |
| :--- |

## Name:

Before the quantitative experiment Ms. Z collected the gas formed into a carefully neutralized solution of methyl orange (acid-base and redox indicator). Although she saw bubbles going through the solution, the colour did not change or fade even after a day.
d) Give the formula of two gases, comprised of elements in the illuminated sample, which could not be present given the results of this experiment.

$$
\mathrm{HCl}, \mathrm{Cl}_{2},\left(\mathrm{O}_{3}, \mathrm{ClO}_{2}\right) \text { (no oxidation of indicator) }
$$

During her quantitative experiment she recorded the absorbance and voltage values regularly. The uncertainty of the spectophotometric measurements is $\pm 0.002$ and the accuracy of the voltage measurements is $\pm 0.3 \mathrm{mV}$.

| time $(\mathrm{min})$ | 0 | 120 | 240 | 360 | 480 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $A_{295 \mathrm{~nm}}$ | 0.3496 | 0.3488 | 0.3504 | 0.3489 | 0.3499 |
| $E(\mathrm{mV})$ | 19.0 | 18.8 | 18.8 | 19.1 | 19.2 |

e) Estimate the average rate of change in the concentrations of $\mathrm{Ce}^{3+}, \mathrm{Cl}^{-}$, and $\mathrm{H}^{+}$.
$\mathrm{d}\left[\mathrm{Ce}^{3+}\right] / \mathrm{d} t=$
$\mathrm{d}\left[\mathrm{Cl}^{-}\right] / \mathrm{d} t=$
$\mathrm{d}\left[\mathrm{H}^{+}\right] / \mathrm{d} t=$

The following day, Ms. Z used an intense monochromatic light beam ( 254 nm ) with an intensity of 0.0500 W . She passed this light through a $5-\mathrm{cm}$ long quartz photoreactor filled with the same acidic $\mathrm{CeCl}_{3}$ solution she had used before. She measured the molar absorption coefficient for $\mathrm{Ce}^{3+}\left(\varepsilon=2400 \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1}\right)$ at 254 nm .
f) What percentage of the light is absorbed in this experimental setup?

$$
A=2400 \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1} \cdot 5 \mathrm{~cm} \cdot 0.0100 \mathrm{M}=120 \Rightarrow\left(100-10^{-118}\right) \% \approx 100 \%
$$

The equipment allowed her to lead the gas first through a drying tube that removed traces of water vapour and then into a closed chamber, whose volume was $68 \mathrm{~cm}^{3}$. The chamber was equipped with a high-precision manometer and an igniter. She first filled the chamber with dry argon to a pressure of 102165 Pa and then she turned on the lamp. In 18.00 hours, the pressure reached 114075 Pa . The temperature of the equipment was $22.0^{\circ} \mathrm{C}$.
g) Estimate the amount of substance of the gas collected in the chamber.

$$
\begin{aligned}
& p_{\text {partial }}=p_{\text {tinal }}-p_{\text {initial }}=114075 \mathrm{~Pa}-102165 \mathrm{~Pa}=11910 \mathrm{~Pa} \\
& n=p_{\text {partial }} V /(R T)=11910 \mathrm{~Pa} \cdot 0.000068 \mathrm{~m}^{3} /(8.314 \mathrm{~J} / \mathrm{mol} / \mathrm{K} \cdot 295.15 \mathrm{~K})=3.3 \cdot 10^{-4} \mathrm{~mol} \\
& 2 \mathrm{pts}
\end{aligned}
$$

$n_{\text {gas }}$ :
At this point, Ms. Z turned off the light and pressed the ignition button. When the chamber cooled down to the initial temperature, the final pressure was 104740 Pa.

Suggest the formula(s) of the gas(es) formed and collected, and give the balanced equation for the original chemical reaction taking place under illumination.

| Gas(es): | identity of gases: $\mathrm{H}_{2}, \mathrm{O}_{2} 4 \mathrm{pts}$ <br> reaction: $2 \mathrm{H}_{2} \mathrm{O} \xrightarrow{\mathrm{hv}} 2 \mathrm{H}_{2}+\mathrm{O}_{2} 1 \mathrm{pt}$ |
| :--- | :--- |
| Reaction: |  |

h) What would be the final pressure after the ignition if the chamber was being filled for 24 hours before ignition?

i) Estimate the quantum yield of product formation in the Ce (III) solution.

Quantum yield:
$3.3 \cdot 10^{-4} \mathrm{~mol}$ gas formed altogether: $2.2 \cdot 10^{-4} \mathrm{~mol} \mathrm{H}_{2}$ and $1.1 \cdot 10^{-4} \mathrm{~mol} \mathrm{O}_{2}$.
Light beam intensity $0.0500 \mathrm{Js}^{-1} \Rightarrow \frac{0.0500 \mathrm{~J} / \mathrm{s} \lambda}{h c N_{A}}=1.06 \cdot 10^{-7} \mathrm{mols}^{-1}$ photon
Total time $18.00 \mathrm{~h}=64800 \mathrm{~s}$
Total number of absorbed photons: $64800 \mathrm{~s} \cdot 1.06 \cdot 10^{-7} \mathrm{mols}^{-1}=6.87 \cdot 10^{-3} \mathrm{~mol}$
Quantum yield for $\mathrm{H}_{2}$ production: $\Phi=2.2 \cdot 10^{-4} \mathrm{~mol} / 6.87 \cdot 10^{-3} \mathrm{~mol}=0.032$
Quantum yield for $\mathrm{O}_{2}$ production: $\Phi=1.1 \cdot 10^{-4} \mathrm{~mol} / 6.87 \cdot 10^{-3} \mathrm{~mol}=0.016$
Either value or the quantum yield of the gas production (0.048) is acceptable when demonstrated in a calculation.

Quantum yield:

## Problem 9 total

## $6 \%$ of the

| 9 a | 9 b | 9 c | 9 d | Task 9 |
| :--- | :--- | :--- | :--- | :--- |
| 12 | 21 | 15 | 9 | 57 |
|  |  |  |  |  |

Thallium exists in two different oxidation states: $\mathrm{Tl}^{+}$and $\mathrm{Tl}^{3+}$. lodide ions can combine with iodine to form tri-iodide ions $\left(\mathrm{I}_{3}{ }^{-}\right)$in aquous solutions,
The standard redox potentials for some relevant reactions are:

$$
\begin{array}{ll}
\mathrm{Tl}^{+}(\mathrm{aq})+\mathrm{e}^{-} \rightarrow \mathrm{Tl}(\mathrm{~s}) & \mathrm{E}_{1}=-0.336 \mathrm{~V} \\
\mathrm{Tl}^{3+}(\mathrm{aq})+3 \mathrm{e}^{-} \rightarrow \mathrm{Tl}(\mathrm{~s}) & \mathrm{E}^{-0}=+0.728 \mathrm{~V}
\end{array}
$$

$$
\mathrm{I}_{2}(\mathrm{~s})+2 \mathrm{e}^{-} \mathrm{c} 2 \mathrm{I}^{-}(\mathrm{aq}) E_{3}^{0_{3}}=+0.540 \mathrm{~V}
$$

The equilibrium constant for the reaction $\mathrm{I}_{2}(\mathrm{~s})+\mathrm{I}^{-}(\mathrm{aq}) \rightarrow \mathrm{I}_{3}{ }^{-}(\mathrm{aq}): K_{1}=0.459$.
Use $T=25^{\circ} \mathrm{C}$ throughout this problem.
a) Calculate the redox potential for the following reactions:

$$
\mathrm{Tl}^{3+}(\mathrm{aq})+2 \mathrm{e}^{-} \rightarrow \mathrm{Tl}^{+}(\mathrm{aq}) \quad E^{\mathrm{o}_{4}}
$$

$$
E_{4}^{\circ}=\frac{3 E_{2}^{\circ}-E_{1}^{\circ}}{2}=1.26 \mathrm{~V} \quad 6 \mathrm{pts}
$$

$E^{-}{ }_{4}=$

$$
\mathrm{I}_{3}^{-}(\mathrm{aq})+2 \mathrm{e}^{-} \rightarrow 3 \mathrm{I}^{-}(\mathrm{aq}) \quad E^{\mathrm{E}_{5}}
$$

$$
E_{5}{ }_{5}=E^{\circ_{3}}+0.059 / 2 \lg \left(1 / K_{1}\right)=0.550 \mathrm{~V} \quad 6 \mathrm{pts}
$$

$\mathrm{E}^{-}{ }_{5}=$
b) Write empirical formulae for all theoretically possible neutral compounds that contain one thallium ion and any number of iodide and/or tri-iodide ion(s) as anion(s).
$\mathrm{Tll}, \mathrm{Tll}_{3}, \mathrm{Tll}_{5}, \mathrm{Tll}_{7}, \mathrm{Tll}_{9} \quad 1$ pt each

There is an empirical formula that could belong to two different compounds. Which one?

Based on the standard redox potentials, which of the two isomers mentioned above is the stable one at standard conditions? Write the chemical reaction for the isomerisation of the other isomer of thallium iodide.

| M | $\mathrm{Tl}^{+}\left(\mathrm{I}_{3}{ }^{-}\right)$ <br> as $E^{-}{ }_{4}>E^{\circ}$ or $E^{-}{ }_{3}$, |
| :---: | :---: |
| Isomerisation: | $\mathrm{Tl}^{3+}+3 \mathrm{I}^{-}=\mathrm{Tl}^{+}+\mathrm{I}_{3}^{-} \quad 6 \mathrm{pts}$ <br> 3 pts for $\mathrm{Tll}_{3}=\mathrm{Tl}\left(\mathrm{I}_{3}\right) ; 0$ pts for $\mathrm{Tl}^{3+}+3 \mathrm{I}^{-}=\mathrm{Tl}^{+}+\mathrm{I}_{2}$ |

Complex formation can shift this equilibrium. The cumulative complex formation constant for the reaction $\mathrm{Tl}^{3+}+4 \Gamma^{-} \rightarrow \mathrm{TlI}_{4}^{-}$is $\beta_{4}=10^{35.7}$
c) Write the reaction that takes place when a solution of the more stable isomer of thallium iodide is treated with an excess of KI. Calculate the equilibrium constant for this reaction.

## Reaction:

$$
\mathrm{Tl}^{+}+\mathrm{I}_{3}^{-}+\mathrm{I}^{-} \rightarrow \mathrm{Tll}_{4}^{-} \quad 3 \text { pts }
$$

This reaction could be regarded as sum of three reactions:
$\mathrm{Tl}^{+}(\mathrm{aq}) \rightarrow \mathrm{Tl}^{3+}(\mathrm{aq})+2 \mathrm{e}^{-}-\mathrm{E}^{{ }^{-}}{ }_{4}=-1.26 \mathrm{~V}$, thus $\Delta_{\mathrm{r}} \mathrm{G}_{4}{ }^{\circ}=n F E_{4}{ }^{\circ}=243.1 \mathrm{~kJ} / \mathrm{mol}$ $\mathrm{I}_{3}{ }^{-}(\mathrm{aq})+2 \mathrm{e}^{-} \rightarrow 3 \mathrm{I}^{-}(\mathrm{aq}) \quad \mathrm{E}_{5}^{0_{5}}=0.550 \mathrm{~V}$, thus $\Delta_{\mathrm{r}} \mathrm{G}_{5}{ }^{\mathrm{o}}=-n F E_{5}{ }^{\circ}=-106.1 \mathrm{~kJ} / \mathrm{mol}$ $\mathrm{Tl}^{3+}+4 \mathrm{I}^{-} \rightarrow \mathrm{Tll}_{4}^{-} \quad \beta_{4}=10^{35.7}$ thus $\Delta_{\mathrm{r}} G_{6}{ }^{\circ}=-R T \ln \beta_{4}=-203.8 \mathrm{~kJ} / \mathrm{mol}$ The net free enthalpy change is $\Delta_{\mathrm{r}} G_{7}{ }^{\circ}=\Delta_{\mathrm{r}} G_{4}{ }^{\circ}+\Delta_{\mathrm{r}} G_{5}{ }^{\circ}+\Delta_{\mathrm{r}} G_{6}{ }^{\circ}=-66.8 \mathrm{~kJ} / \mathrm{mol}$ Thus $K_{2}=\exp \left(-\frac{\Delta_{r} G_{7}}{R T}\right)=4.96 \cdot 10^{11}$ 3 pts each for $\Delta_{r} G^{\circ}{ }_{(4-6)}$ and for $K_{2}$.
$K_{2}$ :

If the solution of the more stable isomer is treated with a strong basic reagent precipitation of a black substance can be observed. After the water content of the precipitate is removed, the remaining material contains $89.5 \%$ thallium (by mass).
d) What is the empirical formula of this compound? Show your calculations. Write a balanced equation for its formation.

> Supposing that the substance contains Tl and an anion, the formula of the compound is $\mathrm{Tl}_{a} \mathrm{X}_{b}$ and the following equation holds:
$\frac{a \cdot 204.4}{a \cdot 204.4+b M_{x}}=0.895$
From the values $b=1,3$ and $a=1,2,3$ only $b=3, a=2$ gives a realistic $M_{X}$ $=16.0 \mathrm{~g} / \mathrm{mol}$.
$X$ is oxygen. $\quad 4 \mathrm{pts}$

Equation:

```
2 Tll}3+6\mp@subsup{\textrm{OH}}{}{-}->\mp@subsup{\textrm{Tl}}{2}{}\mp@subsup{\textrm{O}}{3}{}+6\mp@subsup{\textrm{I}}{}{-}+3\mp@subsup{\textrm{H}}{2}{}\textrm{O}\quad3\mathrm{ pts
2 pts if H+
```

## Instructions

- This examination has 10 pages and 5 pages of answer sheets ( $8+4$ for Task 1-2, 2+1 for Task 3).
- You have $\mathbf{3}$ hours to complete Tasks 1 and 2. After that you will have to leave the laboratory for a short break while the assistants exchange your glassware and chemicals. You will then have 2 hours to work on Task 3.
- Begin only when the START command is given. You must stop your work immediately when the STOP command is given after each part. A delay in doing this by 3 minutes will lead to cancellation of your experimental exam.
- Follow safety rules given in the IChO regulations. At all times while you are in the laboratory you must wear safety glasses or your own glasses if they have been approved, and use the pipette filler bulb provided. Use gloves when handling the organic liquids.
- You will receive only ONE WARNING from the laboratory supervisor if you break safety rules. On the second occasion you will be dismissed from the laboratory with a resultant zero score for the entire experimental examination.
- Do not hesitate to ask a demonstrator if you have any questions concerning safety issues or if you need to leave the room.
- Use only the pen and calculator provided.
- Write your name and code on each answer sheet. Do not attempt to separate the sheets.
- All results must be written in the appropriate areas on the answer sheets. Anything written elsewhere will not be graded. Use the reverse of the sheets if you need scratch paper.
- You will need to reuse some glassware during the exam. Clean them carefully at the sink closest to you.
- Use the labeled waste containers under the hood for the disposal of organic liquids from Task 1 and all liquids from Task 3.
- The number of significant figures in numerical answers must conform to the rules of evaluation of experimental errors. Mistakes will result in penalty points, even if your experimental technique is flawless.
- Chemicals and laboratory ware are not supposed to be refilled or replaced. Each such incident (other than the first, which you will be allowed) will result in the loss of 1 point from your 40 practical points.
- When you have finished a part of the examination, you must put your answer sheets into the envelope provided. Do not seal the envelope.
- The official English version of this examination is available on request only for clarification.

## Apparatus

| For common use in the lab: |
| :--- |
| Heating block preadjusted to $70^{\circ} \mathrm{C}$ under the hood |
| Distilled water (H2O) in jugs for refill |
| Latex gloves (ask for a replacement if allergic to latex) |
| Labeled waste containers for Task 1 (organic liquids) and Task 3 (all liquids) |
| Container for broken glass and capillaries |
| On each desk: |
| Goggles |
| Heat gun |
| Permanent marker |
| Pencil and ruler |
| Stopwatch, ask supervisor about operation if needed. (You can keep it.) |
| Tweezers |
| Spatula |
| Glass rod |
| Ceramic tile |
| Paper tissue |
| Spray bottle with distilled water |
| 9 Eppendorf vials in a foam stand |
| TLC plate in labeled ziplock bag |
| Plastic syringe (100 $\left.\mathrm{cm}^{3}\right)$ with polypropylene filter disc |
| Pipette bulb |
| 14 graduated plastic Pasteur pipettes |
| Petri dish with etched competitor code |
| Burette |
| Stand and clamp |
| Pipette (10 $\left.\mathrm{cm}^{3}\right)$ |
| 2 beakers $\left(400 \mathrm{~cm}^{3}\right)$ |
| Beaker and watchglass lid with filter paper piece for TLC |
| 10 capillaries |
| 2 graduated cylinders $\left(25 \mathrm{~cm}^{3}\right)$ |
| 3 Erlenmeyer flasks $\left(200 \mathrm{~cm}^{3}\right)$ |
| Beaker (250 $\mathrm{cm}^{3}$ ) |
| 2 beakers $\left(100 \mathrm{~cm}^{3}\right)$ |
| Funnel |
| Volumetric flask (100 $\left.\mathrm{cm}^{3}\right)$ |
| 30 test tubes in stand* |
| Indicator paper pieces and pH scale in ziplock bag* |
| Wooden test tube clamp* |
| 2 plugs for test tubes* |

[^0]
## Chemicals

| Sets for 4-6 people | R phrases | S phrases |
| :---: | :---: | :---: |

## Risk and Safety Phrases

| Indication of Particular Risks |  |  |  |
| :---: | :---: | :---: | :---: |
| 1 | Explosive when dry | 33 | Danger of cumulative effects |
| 10 | Flammable | 34 | Causes burns |
| 11 | Highly Flammable | 35 | Causes severe burns |
| 22 | Harmful if swallowed | 39 | Danger of very serious irreversible effects |
| 32 | Contact with concentrated acids liberates very toxic gas |  |  |
| Combination of Particular Risks |  |  |  |
| 20/22 | Harmful by inhalation and if swallowed | 36/38 | Irritating to eyes and skin |
| 23/24/25 | Toxic by inhalation, in contact with skin and if swallowed | 50/53 | Very toxic to aquatic organisms, may cause long-term adverse effects in the aquatic environment |
| 26/27/28 | Very Toxic by inhalation, in contact with skin and if swallowed | 52/53 | Harmful to aquatic organisms, may cause long-term adverse effects in the aquatic environment |
|  |  |  |  |
| 7 | Keep container tightly closed | 30 | Never add water to this product |
| 16 | Keep away from sources of ignition - No smoking | 33 | Take precautionary measures against static discharges |
| 22 | Do not breathe dust | 36 | Wear suitable protective clothing |
| 23 | Do not breathe fumes/vapour | 45 | In case of accident or if you feel unwell, seek medical advice immediately (show label where possible) |
| 25 | Avoid contact with eyes | 60 | This material and/or its container must be disposed of as hazardous waste |
| 26 | In case of contact with eyes, rinse immediately with plenty of water and seek medical advice | 61 | Avoid release to the environment. |
| Combination of Safety Precautions |  |  |  |
| 24/25 | Avoid contact with skin and eyes | 36/37/39 | Wear suitable protective clothing, gloves and eye/face protection |
| 36/37 | Wear suitable protective clothing and gloves |  |  |

## Task 1

## Synthesis of $\alpha$-D-glucopyranose pentaacetate

Caution: Use gloves while manipulating acetic acid and acetic anhydride. Let the lab supervisors know if any is spilled.

Add and mix $12 \mathrm{~cm}^{3}$ of pure acetic acid to $12 \mathrm{~cm}^{3}$ of acetic anhydride (provided in an Erlenmeyer flask) and add 3.00 g glucose (acetic anhydride is used in excess). Add with a Pasteur-pipette 5 drops of $30 \% \mathrm{HClO}_{4}$ dissolved in acetic acid. After the addition of the catalyst the solution might warm up considerably.
Let the mixture rest covered for 10 minutes and swirl it from time to time. Pour the reaction mixture into $100 \mathrm{~cm}^{3}$ of water in a beaker. Scratch the wall of the beaker with a glass rod to initiate crystallization, and let it crystallize for 10 minutes. Filter and wash the product two times with $10 \mathrm{~cm}^{3}$ of water using the syringe and the porous polypropylene filter disc.

## Filtration using a plastic syringe

6

1. Pull out the piston. Fill the syringe from above with the suspension to be filtered. The syringe can be filled to the level of the hole. Replace piston.
2. Cover the hole with your finger and press in the piston as far as the hole.
3. Open the hole and draw the piston back. Do not draw in air through the filter.
4. Repeat steps 2-3 a few times to expel the liquid.
5. Repeat steps $1-4$ until all solids are on the filter.
6. Press the piston against the filter cake and squeeze out the liquid.
7. Wash the product twice with $10 \mathrm{~cm}^{3}$ of water repeating steps 1-4.
8. Press the piston against the filter cake and squeeze out the water.
9. Pull the piston out with the hole closed to lift out the filter cake. (Pushing with the end of the spatula can help.)
a) Place your product in the open Petri dish marked with your code. Leave it on your table. The organizers will dry it, weigh it and check it for purity.
b) Calculate the theoretical yield (mass) of your product in g. $(M(\mathrm{C})=12 \mathrm{~g} / \mathrm{mol}, M(\mathrm{O})=$ $16 \mathrm{~g} / \mathrm{mol}, M(\mathrm{H})=1.0 \mathrm{~g} / \mathrm{mol}$

## Synthesis of $\alpha$-D-glucopyranose pentaacetate from $\beta$-D-glucopyranose pentaacetate

An alternative synthesis of $\alpha$-D-glucopyranose pentaacetate starts from readily available $\beta$ -D-glucopyranose pentaacetate. In this experiment we will study the kinetics of this reaction with thin layer chromatography.

Add $1.5 \mathrm{~cm}^{3}$ acetic anhydride to 50 mg of anhydrous $\mathrm{ZnCl}_{2}$ (preweighed in a test tube). Add 100 mg of pure $\beta$-D-glucopyranose pentaacetate (BPAG) and swirl until dissolved. Take three drops from this mixture into an Eppendorf tube, add $0.5 \mathrm{~cm}^{3}$ methanol and save it.
Place the test tube in the heating apparatus under the hood closest to your desk. Place the test tube in the heating block preadjusted to $70^{\circ} \mathrm{C}$. Mix the contents of the test tube from time to time. During the reaction take three drops of sample from the mixture with a Pasteur pipet after 2, 5, 10, and 30 minutes. Mix immediately each sample with $0.5 \mathrm{~cm}^{3}$ of methanol to stop the reaction in an Eppendorf tube.
Prepare a silica TLC plate with the collected samples to study the reaction kinetics. Apply the necessary reference compounds as well to help identification of the spots on the plate. Mark the spots with a pencil, and develop the plate in isobutyl acetate/ isoamyl acetate (1:1) eluent. Heat the plates with a heat-gun (under the hood!) to visualise the spots (the colour is stable). You can ask for a second plate without penalty points if needed for proper evaluation.
c) Copy your plate on the answer sheet and place your plate in the labeled ziplock bag.
d) Interpret your experimental findings answering the questions on the answer sheet.

## Task 2

Insert this remark in your translation if your students do not know this kind of pipette. Hint: The pipette has two graduation marks. Stop at the second mark to measure out exact volumes. Do not let all the solution to run out.
When potassium hexacyanoferrate $(\mathrm{II}), \mathrm{K}_{4}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]$ is added to a solution containing zinc ions, an insoluble precipitate forms immediately. Your task is to find out the composition of the stoichiometric precipitate that contains no water of crystallization.
The precipitation reaction is quantitative and so quick that it can be used in a titration. The end point can be detected using redox indication, but first the concentration of the potassium hexacyanoferrate(II) solution has to be determined.

## Preparation of $\mathrm{K}_{4}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]$ solution and determination of its exact concentration

Dissolve the solid $\mathrm{K}_{4}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right] .3 \mathrm{H}_{2} \mathrm{O}(M=422.41 \mathrm{~g} / \mathrm{mol})$ sample in the small Erlenmeyer flask and quantitatively transfer it into the $100.00 \mathrm{~cm}^{3}$ volumetric flask. Take $10.00 \mathrm{~cm}^{3}$ portions of the hexacyanoferrate(II) solution. Add $20 \mathrm{~cm}^{3} 1 \mathrm{~mol} / \mathrm{dm}^{3}$ sulfuric acid and two drops of the ferroin indicator solution to each sample before titration. Titrate with the $0.05136 \mathrm{~mol} / \mathrm{dm}^{3} \mathrm{Ce}^{4+}$ solution. Repeat titration as necessary. Cerium(IV) is a strong oxidant under acidic conditions forming Ce (III).
a) Report the $\mathrm{Ce}^{4+}$ solution volumes consumed.
b) Give the equation for the titration reaction. What was the mass of your $\mathrm{K}_{4}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right] \cdot 3 \mathrm{H}_{2} \mathrm{O}$ sample?
The reaction between zinc ions and potassium hexacyanoferrate(II)
Take $10.00 \mathrm{~cm}^{3}$ of the hexacyanoferrate(II) solution and add $20 \mathrm{~cm}^{3} 1 \mathrm{~mol} / \mathrm{dm}^{3}$ sulfuric acid. Add three drops of indicator solution (diphenyl amine) and two drops of $\mathrm{K}_{3}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]$ solution. The indicator only works if the sample contains some hexacyanoferrate(III), $\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]^{3-}$. Titrate slowly with the zinc solution. Continue until a bluish violet colour appears. Repeat titration as necessary.
c) Report the zinc solution volumes consumed.
d) Interpret the titration answering the questions on the answer sheet.
e) Determine the formula of the precipitate.

Caveat: Best marks are not necessarily awarded to measurements reproducing theoretically expected values.

## Task 3

Caution: Handle all unknown solutions as if they were toxic and corrosive. Discard them only in the appropriate waste container.
The heat gun heats the expelled air up to $500^{\circ} \mathrm{C}$. Do not direct the stream towards combustible materials or body parts. Be careful with the hot nozzle.
Always place a single piece of pumice into liquids before heating to avoid bumping. Never point the mouth of a heated test tube towards a person.

You have eight unknown aqueous solutions. Each solution contains only one compound. The same ion may appear in more than one solution. Every compound formally consists of one type of cation and one type of anion from the following list:
Cations: $\mathrm{H}^{+}, \mathrm{NH}_{4}^{+}, \mathrm{Li}^{+}, \mathrm{Na}^{+}, \mathrm{Mg}^{2+}, \mathrm{Al}^{3+}, \mathrm{K}^{+}, \mathrm{Ca}^{2+}, \mathrm{Cr}^{3+}, \mathrm{Mn}^{2+}, \mathrm{Fe}^{2+}, \mathrm{Fe}^{3+}, \mathrm{Co}^{2+}, \mathrm{Ni}^{2+}, \mathrm{Cu}^{2+}$, $\mathrm{Zn}^{2+}, \mathrm{Sr}^{2+}, \mathrm{Ag}^{+}, \mathrm{Sn}^{2+}, \mathrm{Sn}^{4+}, \mathrm{Sb}^{3+}, \mathrm{Ba}^{2+}, \mathrm{Pb}^{2+}, \mathrm{Bi}^{3+}$

Anions: $\mathrm{OH}^{-}, \mathrm{CO}_{3}{ }^{2-}, \mathrm{HCO}_{3}{ }^{-}, \mathrm{CH}_{3} \mathrm{COO}^{-}, \mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}, \mathrm{NO}_{2}^{-}, \mathrm{NO}_{3}{ }^{-}, \mathrm{F}^{-}, \mathrm{PO}_{4}{ }^{3-}, \mathrm{HPO}_{4}{ }^{2-}, \mathrm{H}_{2} \mathrm{PO}_{4}^{-}$, $\mathrm{SO}_{4}^{2-}, \mathrm{HSO}_{4}^{-}, \mathrm{S}^{2-}, \mathrm{HS}^{-}, \mathrm{Cl}^{-}, \mathrm{ClO}_{4}^{-}, \mathrm{MnO}_{4}^{-}, \mathrm{Br}^{-}, \mathrm{I}^{-}$

You have test tubes and heating but no additional reagents apart from distilled water and pH paper.

Identify the compounds in the solutions 1-8. You can use the solubility table for some of the anions on the next page. If you are unable to identify an ion exactly, give the narrowest selection possible.

## Remarks:

The unknown solutions may contain minor impurities arising from their exposure to air. The concentration of all solutions is around $5 \%$ by mass so you can expect clearly observable precipitates from the main components. In some cases, precipitation does not occur instantaneously; some substances may remain in an oversaturated solution for a while. Don't draw negative conclusions too hastily, wait 1-2 minutes where necessary. Always look carefully for all signs of a reaction.
Keep in mind that heating accelerates all processes, increases the solubility of most substances, and may start reactions that do not take place at room temperature.

Name:
Code: XXX-

a) Yield of the product in g, measured by the organizer:

The samples are dried by the organisers. Full pts for a 60-100\% yield, linear scale between 0$60 \%$ yield. The typical yield is $70 \%$.
Purity is checked by solubility (acetone) and TLC. If there is no insoluble material and no impurity is detectable by TLC, the full points for the yield are received.
If there is a considerable (easily visible) amount of insoluble material or impurity on the TLC plate, then 0 point is received for the yield (only possible in case of intentional contamination). 5 points off if filter disc is submitted.
b) Calculate the theoretical yield of your product in g.

$$
\begin{aligned}
& \mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6} \rightarrow \mathrm{C}_{16} \mathrm{H}_{22} \mathrm{O}_{11} \\
& \mathrm{~m}=\frac{3.00 \mathrm{~g} \cdot 390 \mathrm{~g} / \mathrm{mol}}{180 \mathrm{~g} / \mathrm{mol}}=6.5 \mathrm{~g}
\end{aligned}
$$

Theoretical yield:
c) Sketch your developed TLC plate and leave on your desk to be evaluated,
$\square$
d) Interpret your experiment and choose the correct answer.

The acetylation reaction of glucose is exothermic.
a) Yes
b) No
c) Cannot be decided based on these experiments

The isomerisation reaction of $\beta$-D-glucopyranose pentaacetate can be used for the

a) Yes
b) No
c) Cannot be decided based on these experiments

Solutions: a, a (2 pts. each)

## Task 2

## $15 \%$ of the total

| 2 a | 2 b | 2c | 2 d | 2 e | Task 2 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 25 | 4 | 25 | 6 | 5 | 65 |
|  |  |  |  |  |  |

a) $\mathrm{Ce}^{4+}$ consumptions:

Full marks ( 25 pts.) if $V_{1}$ is within $0.15 \mathrm{~cm}^{3}$ of the expected value recalculated from the $\mathrm{K}_{4}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]$ mass. Zero marks if deviation is more than $0.50 \mathrm{~cm}^{3}$. Linear scale is applied in between.
Average volume consumed $\left(V_{1}\right)$ :
b) The titration reaction:

$$
\begin{array}{ll}
\mathrm{Ce}^{4+}+\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]^{4-}=\mathrm{Ce}^{3+}+\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]^{3-} & 2 \mathrm{pts} . \\
\text { or } \\
\mathrm{Ce}^{4+}+\mathrm{Fe}^{2+}=\mathrm{Ce}^{3+}+\mathrm{Fe}^{3+} & 1 \mathrm{pt}
\end{array}
$$

Calculation of sample mass:

$$
m=c_{\mathrm{Ce}} V_{1} 10 \cdot M
$$

Actual sample masses will be distributed with the exam copies.
$\mathrm{K}_{4}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right] \cdot 3 \mathrm{H}_{2} \mathrm{O}$ mass $(m)$ :
c) Zinc consumptions:

Full marks ( 25 pts.) if $V_{2}$ is within $0.15 \mathrm{~cm}^{3}$ of the expected value recalculated from $\mathrm{K}_{4}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]$ mass, zinc concentrations and empirical ratio. Zero marks if the deviation is more than $0.50 \mathrm{~cm}^{3}$. Linear scale is applied in between.
Average volume consumed $\left(V_{2}\right)$ :
d) Mark the correct answer.

The diphenyl amine indicator changes in colour at the end point
$\square$ a) because the concentration of the $\mathrm{Zn}^{2+}$ ions increases.
b) because the concentration of the $\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]^{4-}$ ions decreases.
c) because the concentration of the $\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]^{3-}$ ions increases.
d) because the indicator is liberated from its complex.

Which form of the indicator is present before the end point?
$\square$ a) Oxidized
b) Reduced
c) Complexed to a metal ion

At the beginning of the titration the redox potential for the hexacyanoferrate(II) hexacyanoferrate(III) system is lower than the redox potential of the diphenyl amine indicator.
a) True
b) False

Solutions: b, b, a (2 pts. each)
e) Determine the formula of the precipitate. Show your work.

The mole ratio of the zinc:hexacyanoferrate(II) in the precipitate can be evaluated as:
$n_{\mathrm{Zn}} / n_{\mathrm{Fe}(\mathrm{CN})_{6}}=\frac{10 c_{\mathrm{Zn}} V_{2} M}{m}$
Values for $c_{Z n}$ are distributed according to country color (found on seating plan)
Red/Pink: 0.0500 Green: $0.0450 \quad$ Blue: $0.0475 \quad$ Yellow/Ivory: 0.0525
The empirical ratio obtained from the experiments is 1.489.
Calculating the zinc/hexacyanoferrate(II) ratio:
Cations are needed to make the precipitate neutral and only potassium is present.
The precipitate is $\mathrm{K}_{2} \mathrm{Zn}_{3}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]_{2}$.
2 pts.
Any other reasonable calculation giving the same result is accepted.
Hydrogen instead of potassium $\left(\mathrm{H}_{2} \mathrm{Zn}_{3}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]_{2}\right.$ or $\left.\mathrm{KHZn}_{3}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]_{2}\right)$ is also acceptable.

Mistakes in units, dilution factors, significant figures (not 3 or 4 in 2 b ) carry a penalty of 1 pt. in each calculation.

The formula of the precipitate:

## Task 3

## $15 \%$ of the total

Task 3
108

Only fill out this table when you are ready with all your assignments.

|  | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | 5 | $\mathbf{6}$ | $\mathbf{7}$ | $\mathbf{8}$ |

| Cation |  |  |  |  |  |  |  |  |
| Anion |  |  |  |  |  |  |  |  |

6 pts for each correctly identified ion except for $\mathrm{HCO}_{3}{ }^{-}$and $\mathrm{HS}^{-}$which are worth 12 pts, bringing up the total to 108 points.

Partial points will be awarded in the following cases:
Anions:
$\mathrm{AgNO}_{3}$ : Full points if $\mathrm{NO}_{3}{ }^{-}$is the only anion shown. 3 pts for $\mathrm{ClO}_{4}{ }^{-}$only. 3 pts if fluoride appears together with nitrate and/or perchlorate. Otherwise 0 pt.
$\mathrm{Pb}\left(\mathrm{CH}_{3} \mathrm{COO}\right)_{2}: 3$ pts if $\mathrm{NO}_{3}{ }^{-}$and/or $\mathrm{ClO}_{4}{ }^{-}$appear together with $\mathrm{CH}_{3} \mathrm{COO}^{-} .1 \mathrm{pt}$ for nitrate and/or perchlorate on their own. Otherwise 0 pt.
3 pts for $\mathrm{CO}_{3}{ }^{2-}$ instead of $\mathrm{HCO}_{3}^{-}$, and for $\mathrm{S}^{2-}$ instead of $\mathrm{HS}^{-}$.
Cations:
In the case of all alkali metal compounds, 2 pts for an incorrect alkali metal. 1 pt for $\mathrm{Ca}^{2+}$ or $\mathrm{Sr}^{2+}$ instead of $\mathrm{Ba}^{2+}$.

## Solution

The solutions received by the students contain the following compounds. The country colours can be found on the laboratory seating plan.

| Country colour | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Blue | $\mathrm{AgNO}_{3}$ | $\mathrm{KHCO}_{3}$ | $\mathrm{NH}_{4} \mathrm{ClO}_{4}$ | NaOH | NaHS | $\mathrm{Pb}(\mathrm{OAc})_{2}$ | $\mathrm{Bal}_{2}$ | $\mathrm{MgSO}_{4}$ |
| Green | $\mathrm{Pb}(\mathrm{OAc})_{2}$ | $\mathrm{NH}_{4} \mathrm{ClO}_{4}$ | NaOH | NaHS | $\mathrm{MgSO}_{4}$ | $\mathrm{KHCO}_{3}$ | $\mathrm{AgNO}_{3}$ | $\mathrm{BaI}_{2}$ |
| Ivory | $\mathrm{NH}_{4} \mathrm{ClO}_{4}$ | $\mathrm{Pb}(\mathrm{OAc})_{2}$ | $\mathrm{KHCO}_{3}$ | $\mathrm{Bal}_{2}$ | $\mathrm{AgNO}_{3}$ | $\mathrm{MgSO}_{4}$ | NaHS | NaOH |
| L.Blue | NaHS | $\mathrm{MgSO}_{4}$ | $\mathrm{Bal}_{2}$ | $\mathrm{NH}_{4} \mathrm{ClO}_{4}$ | $\mathrm{Pb}(\mathrm{OAc})_{2}$ | $\mathrm{AgNO}_{3}$ | NaOH | $\mathrm{KHCO}_{3}$ |
| L.Green | $\mathrm{Bal}_{2}$ | NaHS | $\mathrm{MgSO}_{4}$ | $\mathrm{AgNO}_{3}$ | NaOH | $\mathrm{NH}_{4} \mathrm{ClO}_{4}$ | $\mathrm{KHCO}_{3}$ | $\mathrm{Pb}(\mathrm{OAc})_{2}$ |
| Pink | $\mathrm{MgSO}_{4}$ | NaOH | $\mathrm{AgNO}_{3}$ | $\mathrm{Pb}(\mathrm{OAc})_{2}$ | $\mathrm{KHCO}_{3}$ | $\mathrm{BaI}_{2}$ | $\mathrm{NH}_{4} \mathrm{ClO}_{4}$ | NaHS |
| Red | NaOH | $\mathrm{BaI}_{2}$ | $\mathrm{Pb}(\mathrm{OAc})_{2}$ | $\mathrm{KHCO}_{3}$ | $\mathrm{NH}_{4} \mathrm{ClO}_{4}$ | NaHS | $\mathrm{MgSO}_{4}$ | $\mathrm{AgNO}_{3}$ |
| Yellow | $\mathrm{KHCO}_{3}$ | $\mathrm{AgNO}_{3}$ | NaHS | $\mathrm{MgSO}_{4}$ | $\mathrm{Bal}_{2}$ | NaOH | $\mathrm{Pb}(\mathrm{OAc})_{2}$ | $\mathrm{NH}_{4} \mathrm{ClO}_{4}$ |

The problem can be approached in many ways. Intuition is very helpful in the tentative assignment of some compounds in the early phases of the work. A systematic solution is given here for the blue Country colour.
All solutions are colourless (NaHS may be slightly yellowish because of polysulfide impurity). Solutions 1, 3, 6, 7, and 8 are practically neutral ( pH paper reading about 5-6). Solution 2 is basic $(\mathrm{pH}=9)$ while solutions 4 and 5 are very strongly basic $(\mathrm{pH}>11)$.
We can exclude all ions that only form coloured compounds in aqueous solutions: $\mathrm{Cr}^{3+}$, $\mathrm{Fe}^{2+}, \mathrm{Fe}^{3+}, \mathrm{Co}^{2+}, \mathrm{Ni}^{2+}, \mathrm{Cu}^{2+}$, and $\mathrm{MnO}_{4}^{-}$. (In principle we should also exclude $\mathrm{Mn}^{2+}$ but its solutions have a very light pink colour that might be mistaken for colourless. The yellowish solution is strongly basic hence its colour cannot be attributed to iron.) The compounds of $\mathrm{H}^{+}, \mathrm{Sn}^{2+}, \mathrm{Sn}^{4+}, \mathrm{Sb}^{3+}, \mathrm{Bi}^{3+}$, and $\mathrm{HSO}_{4}^{-}$with the possible counter-ions could only exist in markedly acidic solutions; therefore they can also be safely excluded.

Thus the list of possible ions is:
Cations: $\mathrm{NH}_{4}^{+}, \mathrm{Li}^{+}, \mathrm{Na}^{+}, \mathrm{Mg}^{2+}, \mathrm{Al}^{3+}, \mathrm{K}^{+}, \mathrm{Ca}^{2+}, \mathrm{Mn}^{2+}, \mathrm{Zn}^{2+}, \mathrm{Sr}^{2+}, \mathrm{Ag}^{+}, \mathrm{Ba}^{2+}, \mathrm{Pb}^{2+}$.
Anions: $\mathrm{OH}^{-}, \mathrm{CO}_{3}{ }^{2-}, \mathrm{HCO}_{3}^{-}, \mathrm{CH}_{3} \mathrm{COO}^{-}, \mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}, \mathrm{NO}_{2}^{-}, \mathrm{NO}_{3}^{-}, \mathrm{F}^{-}, \mathrm{PO}_{4}{ }^{3-}, \mathrm{HPO}_{4}{ }^{2-}, \mathrm{H}_{2} \mathrm{PO}_{4}^{-}$, $\mathrm{SO}_{4}{ }^{2-}, \mathrm{S}^{2-}, \mathrm{HS}^{-}, \mathrm{Cl}^{-}, \mathrm{ClO}_{4}^{-}, \mathrm{Br}^{-}, \mathrm{I}^{-}$.

The unknown solutions react with each other as follows ( $\downarrow=$ precipitate; $\uparrow=$ volatile product; "no change" means even when boiled, unless indicated otherwise):

|  | $\begin{gathered} 1 \\ \mathrm{AgNO}_{3} \end{gathered}$ | $\underset{\mathrm{KHCO}_{3}}{2}$ | $\begin{gathered} 3 \\ \mathrm{NH}_{4} \mathrm{ClO}_{4} \end{gathered}$ | $\begin{gathered} 4 \\ \mathrm{NaOH} \end{gathered}$ |  | $\begin{gathered} 6 \\ \operatorname{Pb}(\mathrm{OAc})_{2} \end{gathered}$ | $\begin{gathered} 7 \\ \mathrm{Bal}_{2} \end{gathered}$ | $\underset{\mathrm{MgSO}_{4}}{8}$ |

(*): upon boiling, the formation of $\mathrm{NH}_{3}$ is detectable by its odour and by pH paper.
(**): gas bubbles are usually not observed when $\mathbf{2}$ is in excess.
$\left.{ }^{* * *}\right)$ : upon boiling, an odourless gas evolves and a white precipitate forms.
$\left(^{* * * *)}\right.$ : upon boiling, a white precipitate forms and the odour of $\mathrm{H}_{2} \mathrm{~S}$ appears.
$2 \mathrm{Ag}^{+}+2 \mathrm{HCO}_{3}^{-}=\mathrm{Ag}_{2} \mathrm{CO}_{3}+\mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}$
$\mathrm{Pb}^{2+}+2 \mathrm{HCO}_{3}^{-}=\mathrm{PbCO}_{3}+\mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}$
$\mathrm{Ba}^{2+}+2 \mathrm{HCO}_{3}^{-}=\mathrm{BaCO}_{3}+\mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}$
$\mathrm{Mg}^{2+}+2 \mathrm{HCO}_{3}^{-}=\mathrm{MgCO}_{3}+\mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}$ (more accurately, basic carbonates of variable composition are formed)
$\mathrm{Ag}^{+}+\mathrm{I}^{-}=\mathrm{AgI} ; \quad 2 \mathrm{Ag}^{+}+\mathrm{SO}_{4}^{2-}=\mathrm{Ag}_{2} \mathrm{SO}_{4} ; \quad \mathrm{Ag}^{+}+\mathrm{CH}_{3} \mathrm{COO}^{-}=\mathrm{CH}_{3} \mathrm{COOAg}$
$\mathrm{Pb}^{2+}+2 \mathrm{OH}^{-}=\mathrm{Pb}(\mathrm{OH})_{2} ; \mathrm{Pb}^{2+}+2 \mathrm{I}^{-}=\mathrm{Pbl}_{2} ; \quad \mathrm{Pb}^{2+}+\mathrm{SO}_{4}{ }^{2-}=\mathrm{PbSO}_{4}$
$\mathrm{K}^{+}+\mathrm{ClO}_{4}^{-}=\mathrm{KClO}_{4} ; \quad \mathrm{Ba}^{2+}+\mathrm{SO}_{4}^{2-}=\mathrm{BaSO}_{4} ; \quad \mathrm{Mg}^{2+}+2 \mathrm{OH}^{-}=\mathrm{Mg}(\mathrm{OH})_{2}$
$2 \mathrm{Ag}^{+}+2 \mathrm{OH}^{-}=\mathrm{Ag}_{2} \mathrm{O}+\mathrm{H}_{2} \mathrm{O}$
$2 \mathrm{Ag}^{+}+\mathrm{HS}^{-}=\mathrm{Ag}_{2} \mathrm{~S}+\mathrm{H}^{+} ; \mathrm{Pb}^{2+}+\mathrm{HS}^{-}=\mathrm{PbS}+\mathrm{H}^{+} ; \quad \mathrm{CH}_{3} \mathrm{COO}^{-}+\mathrm{H}^{+}=\mathrm{CH}_{3} \mathrm{COOH}$
$\mathrm{NH}_{4}{ }^{+}+\mathrm{OH}^{-}=\mathrm{NH}_{3}+\mathrm{H}_{2} \mathrm{O}$
$\mathrm{NH}_{4}{ }^{+}+\mathrm{HCO}_{3}{ }^{-}=\mathrm{NH}_{3}+\mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}$

Two groups of the observed phenomena give instant clues to the identification of some of the ions.
First, the reactions of $\mathbf{2}$ are often accompanied with the formation of a colourless and odourless gas that can only be $\mathrm{CO}_{2}$. Thus 2 contains $\mathrm{CO}_{3}{ }^{2-}$ or $\mathrm{HCO}_{3}{ }^{-}$.
Second, there are only 3 dark precipitates that can form from the given ions: $\mathrm{Ag}_{2} \mathrm{O}, \mathrm{Ag}_{2} \mathrm{~S}$, and PbS . This fact, together with the pH of the solutions, instantly identifies the cation of $\mathbf{1}$ as $\mathbf{A g}^{+}$, the cation of $\mathbf{6}$ as $\mathbf{P b}^{2+}$, the anion of $\mathbf{4}$ as $\mathbf{O H}^{-}$, and the anion of 5 as sulfide or hydrosulfide (confirmed by the distinct smell of the solution).
The choice between the latter two can be made by measuring the pH of the solution formed in the reaction of $\mathbf{5}$ with an excess of $\mathbf{1}$ or $\mathbf{6}$. In the case of $\mathbf{1}$, the reaction mixture is strongly acidic. Thus the anion of 5 is $\mathrm{HS}^{-}$.
The evolution of $\mathrm{CO}_{2}$ in the reaction with $\mathrm{Ag}^{+}$and $\mathrm{Pb}^{2+}$ also identifies the anion of $\mathbf{2}$ as $\mathrm{HCO}_{3}{ }^{-}$. (in accord with the moderately basic pH )
The reaction of $\mathbf{3}$ and $\mathbf{4}$ yields ammonia. $\mathbf{4}$ is obviously not a solution of $\mathrm{NH}_{3}$ itself. Thus the cation of $\mathbf{3}$ is $\mathbf{N H}_{4}{ }^{+}$.
$\mathbf{2 + 4}$ do not form either a precipitate or ammonia. The cations of $\mathbf{2}$ and $\mathbf{4}$ are $\mathrm{Na}^{+}$or $\mathrm{K}^{+}$.
$2+5$ do not form either a precipitate or ammonia. The cation of 5 is an alkali metal.
$\mathbf{3}$ is the only solution that does not give a precipitate with $\mathrm{Ag}^{+}$. Accordingly, it can be ammonium nitrate, fluoride, or perchlorate. But it does give a precipitate with 2, a hydrocarbonate of $\mathrm{Na}^{+}$or $\mathrm{K}^{+}$. Thus the anion of $\mathbf{3}$ is $\mathrm{ClO}_{4}^{-}$and the cation of $\mathbf{2}$ is $\mathbf{K}^{+}$.
4 does not give a precipitate with $\mathrm{NH}_{4} \mathrm{ClO}_{4}$. The cation of $\mathbf{4}$ is $\mathrm{Na}^{+}$.
5 does not give a precipitate either with $\mathrm{NH}_{4} \mathrm{ClO}_{4}\left(\mathrm{~K}^{+}\right)$or with a mixture of $\mathrm{KHCO}_{3}$ and $\mathrm{NaOH}\left(\mathrm{Li}^{+}\right)$. The cation of 5 is $\mathrm{Na}^{+}$.
7 forms no precipitate or ammonia with NaOH but gives a precipitate with $\mathrm{KHCO}_{3} .7$ cannot be an alkali metal perchlorate because it forms yellow precipitates with $\mathbf{1}$ and 6 . Thus the cation of $\mathbf{7}$ is $\mathbf{B a}^{2+}$ and the anion of $\mathbf{7}$ is $\mathbf{I}^{-}$.
At room temperature $\mathbf{8}$ gives a precipitate with $\mathrm{OH}^{-}$but not with $\mathrm{HS}^{-}$which means it can only be a salt of a Group 2A metal. Thus the reaction of 8 with $\mathrm{Bal}_{2}$ is obviously one
between $\mathrm{Ba}^{2+}$ and the anion of 8 . The latter is very likely $\mathrm{SO}_{4}{ }^{2-}$ but $\mathrm{HCO}_{3}{ }^{-}$and $\mathrm{H}_{2} \mathrm{PO}_{4}{ }^{-}$are also theoretically possible. The solution of $\mathbf{8}$ is unchanged upon boiling and gives a white precipitate with $\mathrm{Ag}^{+}$. This excludes both $\mathrm{HCO}_{3}{ }^{-}$and $\mathrm{H}_{2} \mathrm{PO}_{4}{ }^{-}$. Thus the anion of $\mathbf{8}$ is $\mathbf{S O}_{4}{ }^{2-}$. This instantly identifies the cation of $\mathbf{8}$ as $\mathbf{M g}^{\mathbf{2 +}}$.
6 is a soluble compound of lead. The anion could be $\mathrm{CH}_{3} \mathrm{COO}^{-}, \mathrm{NO}_{2}^{-}, \mathrm{NO}_{3}^{-}$, or $\mathrm{ClO}_{4}^{-}$. The slight odour of acetic acid might give a clue. Unlike 1, the reaction of an excess of 6 with $\mathrm{HS}^{-}$does not yield a markedly acidic solution which shows that $\mathbf{6}$ is a salt of a weak acid. If 6 were a nitrite, it would give a yellowish precipitate with $\mathrm{Ag}^{+}$. It would also react with $\mathrm{NH}_{4} \mathrm{ClO}_{4}$ upon heating with the evolution of $\mathrm{N}_{2}$ (and nitrogen oxides from the reaction with $\mathrm{HS}^{-}$would also be noticeable). The absence of these reactions indicates that the anion of 6 is $\mathrm{CH}_{3} \mathrm{COO}^{-}$.

Soluble salts of silver are even less numerous, the only choices are $\mathrm{NO}_{3}{ }^{-}$, $\mathrm{F}^{-}$, and $\mathrm{ClO}_{4}{ }^{-}$. The anion can be examined if one removes the silver ions from the solution of 1 with an excess of NaOH . The $\mathrm{Ag}_{2} \mathrm{O}$ precipitate quickly separates from the solution which can be easily poured off. This solution, containing the anion of 1, does not give a precipitate with $\mathrm{Bal}_{2}$ which rules out $\mathrm{F}^{-}$. The solubility of $\mathrm{KClO}_{4}$ is quite significant; therefore the absence of a precipitate with $\mathrm{KHCO}_{3}$ is inconclusive. The anion of $\mathbf{1}$ is therefore either $\mathrm{NO}_{3}{ }^{-}$or $\mathrm{ClO}_{4}^{-}$.
